## Friday P, NP, NP-complete Problems:-

### Introduction

[Only there are few useful algorithms, we have  $\log > 3$ ]

Note :-

Even though Knapsack (NP) looks like tractable, when  $n$  increases, it can't be solved in polynomial time  $\Rightarrow$  non-tractable.

↓  
[Combinatorial Problem]

[If a problem can't be solved in polynomial time, then it exponentially varies]

$\Rightarrow$  An algorithm solves a problem in polynomial time if its worst case time efficiency belongs to  $O(P(n))$  where  $P(n)$  is a polynomial of the problem's input size  $n$ . Example:-  $n, \log n$

$\Rightarrow$  Problems that can be solved in polynomial time are called tractable and problems that cannot be solved in polynomial time are called intractable.

### P-CLASS :-

Decision problems - Problems which give Yes/No (T/F) as solution

$\Rightarrow$  Informally, we can think about problems that can be solved in polynomial time as the set that computer science theoreticians call P.

$\Rightarrow$  All decision problems (that can be solved in polynomial time) are in P.

$\Rightarrow$  'Class P' is a class of decision that can be solved in polynomial time by (deterministic) algorithms. This class of problems is called polynomial.

$\Rightarrow$  Decidable and undecidable problems

$\Rightarrow$  Deterministic algorithm:-

Given an algorithm and a particular i/p, what it always produces the same output is called as a deterministic algorithm.

$\Rightarrow$  Non-deterministic algorithm:- (eg- Randomized algorithm)

Given an algorithm and a particular i/p, even for the same i/p everytime, it gives us different outputs.

[Randomised algo + a particular probability gives a proper output]

$\Rightarrow$  Its behaviour can vary if the algorithm runs multiple times on same input.

[Randomised algo + a particular probability gives a proper output]  
 ↓  
 Its behaviour can vary if the algorithm runs multiple times on same input.

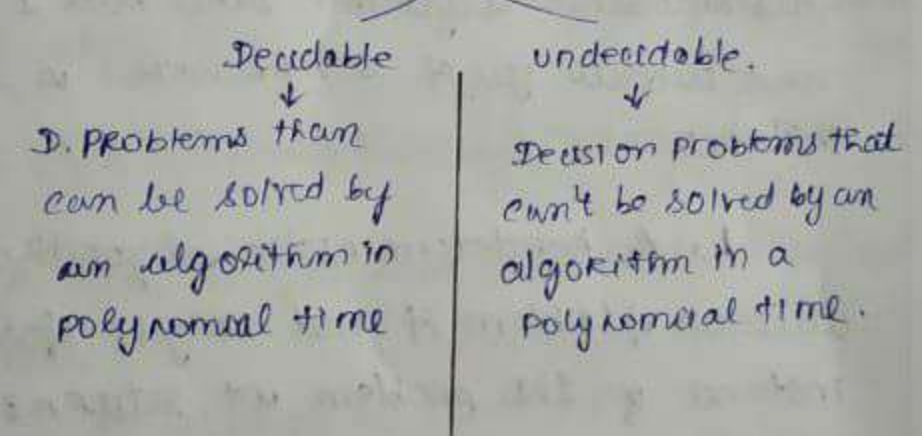

## → Randomised Algorithm:

Here in addition to I/P, a set of random numbers are taken, so the instructions executed gets vary hence o/p varies too. [eg during execution, it takes random choices depending on those random numbers.]

Even though some problems can't be solved in polynomial time, it may have a decision version. Eg- All optimisation can't be solved in polynomial. But if it can be reduced to decision problem then it can be solved in polynomial. eg- Travel salesman problem [its decision version can be solved in polynomial time]

## Decision Problem

## NP PROBLEM

combinatorial problem

- ① Hamiltonian circuit problem: decision counterpart
- ② Travelling salesman problem: decision counterpart
- ③ Knapsack problem: decision counterpart
- ④ Partition Problem: - Given 'n' +ve integers, determine whether it is possible to partition them into 2 disjoint subsets with the same sum.

eg:- {1, 2, 3, 4, 5}  
 {1, 4, 5} {2, 3}  
 [sum should be same]  
 → (5 = 5) here

Counter part of Euler circuit  
↓  
[Whether Euler circuit exists in a graph (or) not]

EULER CIRCUIT can be solved in polynomial time.

[Start from a vertex, visit every edge exactly once and return back to the same vertex] → EULER CIRCUIT

Shortcut:- In a given graph, if degree is even for all vertices, then we can conclude that the graph has Euler circuit.

CLASS NP

↳ A non-deterministic algorithm is a 2-stage procedure that takes as its input an instance  $I$  of a decision problem and does the following:-

(i) - Nondeterministic ("guessing") stage:- An arbitrary string  $S$  is generated that can be thought of as a candidate solution to the given instance  $I$ .

(ii) - Deterministic ("verification") stage:- A deterministic algorithm takes both  $I$  and  $S$  as i/p and outputs yes if  $S$  represents a solution to an instance  $I$ . (algo used here is in P)

↳ A nondeterministic algorithm solves a decision problem if and only if for every yes instance of the problem it returns yes on some execution.

- a nondeterministic algorithm to be capable of "guessing" a solution at least once and to be able to verify its validity.

↳ A nondeterministic algorithm is said to be non-deterministic polynomial if the time efficiency of its verification stage is polynomial.

Hamiltonian graph

→ Class NP is the class of decision problems that can be solved by non-deterministic polynomial algorithms. This class of problems is called as non-deterministic polynomial.  
Yes,  $P \subseteq NP$  - Decision Problems

⇒ NP-complete problems:

→ A decision problem  $D_1$  is said to be polynomially reducible to a decision problem  $D_2$ , if there exists a function  $t$  that transforms instances of  $D_1$  to instances of  $D_2$  such that:

- $t$  maps all yes instances of  $D_1$  to yes instances of  $D_2$  and all no instances of  $D_1$  to no instances of  $D_2$ .
- $t$  is computable by a polynomial time algorithm.

Eg:- Hamiltonian circuit and TSP.

→ A decision problem  $D$  is said to be NP complete if:

- It belongs to class NP
  - every problem in NP is polynomially reducible to  $D$ .
- A Related  
→ Decision Problem

⇒ CNF - SATISFIABILITY PROBLEM:-

CNF - Conjunction of Disjunction  
eg:  $(a \vee b \vee c) \wedge (a \vee \bar{c}) \wedge (a \vee b)$

→ Given a Boolean variable and CNF expression, is there a possibility of assigning truth variable value to variable and find whether the expression gives me truth (T).

NO. of blocks =  $L \times B \times R \times I$

Index entry size =  $R \times I = (V_{size} + P_r)$

BFI =  $L \times B \times R \times I$

Block

$\sim (b/RFI)$

NO. of edge for  
2 vertices is 1  
and edge of 2

$$\begin{aligned}
 \text{DFT} \{ c_1 x(n) + c_2 y(n) \} &= \sum_{n=0}^{N-1} \{ c_1 x(n) + c_2 y(n) \} W_N^{nk} \\
 &= c_1 \sum_{n=0}^{N-1} x(n) W_N^{nk} + c_2 \sum_{n=0}^{N-1} y(n) W_N^{nk} \\
 &= c_1 X(k) + c_2 Y(k)
 \end{aligned}$$

Eg:-  $(a \vee b \vee c) \wedge (\bar{a} \vee \bar{b}) \wedge (\bar{a} \vee \bar{c})$

- It's a NP problem
- (i) Take  $a=T, b=T, c=F$   $(a \vee b \vee c)$ 
    - $\Rightarrow$  The final Truth value is  $T \wedge F \wedge T = \textcircled{F}$
  - (ii) Take  $a=T, b=F, c=T$ 
    - $\Rightarrow$  Final Truth value is  $T \wedge T \wedge T = \textcircled{T}$
